

Requirements Table - Second-Hand Product Escrow Marketplace

Student: Samarth Mohan | **SRN:** PES1UG24CS703 | **Lab 1**

Req ID	Type	Description	Priority	Acceptance Criteria	Rationale
FR-001	Functional	The system shall lock buyer payment in escrow and change order state to 'Under Inspection' until an inspection agent submits sign-off.	High	Pass: Money stays locked and moves only after buyer + inspector approval. Fail: Money goes to seller early. Check escrow ledger and order state.	Stops fraud; core trust step. If this fails, money is lost. So High.
FR-002	Functional	The system shall let a buyer browse products, place an order, and pay via payment gateway to fund the escrow.	High	Pass: Buyer can search, view, click Buy, pay, and see status 'Funds Locked' and order ID. Fail: Payment not locked or no order made.	Core buying step. No order means no escrow. So High.
FR-003	Functional	The system shall let an inspection agent claim an order and upload a report with photos, condition grade, and remarks.	Medium	Pass: Agent can pick 'Under Inspection' order, upload >=2 photos + grade (Pass/Fail/Needs Fix) and buyer gets notice in <5 min. Fail: Upload fails or no notice.	Builds trust but first version can work with simple photo upload. Not as urgent as money lock, so Medium.

Req ID	Type	Description	Priority	Acceptance Criteria	Rationale
FR-004	Functional	The system shall let the buyer view the inspection report and either approve to release money or raise a dispute with a reason.	Medium	Pass: Buyer sees report and can click Approve or Dispute (with reason text); status updates to 'Approved' or 'Disputed' within 2s. Fail: Buyer cannot act or status not updated.	Buyer control is needed but has 48h window and auto-reminder, so Medium (not instant blocker).
FR-005	Functional	The system shall release money to seller only after buyer approval and inspection pass, or refund to buyer if inspection fails/dispute upheld, and set order to Closed.	High	Pass: On approval money moves to seller wallet; on fail/dispute money returns to buyer within 24 hrs; order = Closed. Fail: Wrong account gets money.	Money must go to right person. Legal and trust risk if wrong, so High.
NFR-001	Non-Functional (Perf. & Security)	Dispute tickets must freeze escrow money at once and block withdrawals while case is open.	High	Pass: Freeze in <2 s after dispute; withdraw API returns 'blocked'; no bypass in security test under load. Fail: Money moves during dispute.	If money moves during fight, trust is broken and law risk. So High.
NFR-002	Non-Functional (Perf. & Security)	The system shall lock escrow payments and update inspection status in under 2 s for 500 concurrent users, keep logs safe, and keep data encrypted.	Low	Pass: Load test 500 users: 95% locks <2 s; logs are append-only; data encrypted in transit and at rest. Fail: Slower or logs can be edited.	500 users is future scale. First launch can handle 100 users. Important but can be improved later, so Low for now.
